

Active Optical Cable Silicon Photonics Configuration Scheme

Article Overview

Silicon photonics-based Active Optical Cables (AOCs) integrate high-speed electrical-to-optical conversion on compact silicon chips, enabling multi-lane optical transmission with high bandwidth and low power consumption.

Core Architecture

A silicon photonics AOC consists of transmitter (Tx) and receiver (Rx) silicon photonics chips permanently attached to both ends of a fiber optic cable . The main components include:

- **Transmitter (Tx) Chip:** Converts multiple high-speed electrical channels into optical signals. A single laser source is coupled into a waveguide, then split into multiple lanes (e.g., four 25 Gb/s lanes for a 100 Gb/s transceiver) using integrated modulators .
- **Receiver (Rx) Chip:** Converts incoming optical signals back into electrical signals using photodiodes and transimpedance amplifiers (TIAs) .
- **Driver and TIA Electronics:** High-speed electronic chips interface the silicon photonics chips with standard connectors such as QSFP+, QSFP28, or OSFP .
- **Fiber Ribbon Holder:** Ensures precise alignment of optical fibers to the silicon photonics chips, critical for low-loss optical coupling .
