

Belgian aggregation switch LPO

Article Overview

The Belgian aggregation switch LPO refers to the Light Prequalification Process that allows foreign and aggregated capacities to participate in Belgium's Capacity Remuneration Mechanism (CRM).

Overview of Aggregators in Belgium

Aggregators are market participants that combine multiple smaller electricity resources—such as distributed generation, demand response, or storage—into a single portfolio to participate in the electricity market. They emerged as a result of market liberalization, which aimed to increase cross-border trading, improve system efficiency, and support security of supply and energy efficiency objectives. Aggregators interact closely with Transmission System Operators (TSOs) to manage imbalances and contribute to system balancing, making them key players in Belgium's electricity market .

Belgian Capacity Remuneration Mechanism (CRM)

The CRM compensates capacity providers for the portion of their costs not covered by market revenues, known as “missing money.” It applies to new, existing, or refurbished capacity and is structured as a 1-year contract. Participation is limited by the Maximum Entry Capacity (MEC), and multi-year contracts are not currently available .
