

Broadband Fiber Optic Connection

Article Overview

Fiber optic broadband delivers high-speed internet by transmitting data as light through glass or plastic fibers, connecting homes or businesses via an Optical Network Terminal (ONT) and router setup.

How Fiber Optic Connections Work

Fiber optic internet uses thin strands of glass or plastic to transmit data as pulses of light, rather than electrical signals used in copper or coaxial cables, resulting in faster speeds, lower latency, and higher reliability . The light signals carry information over long distances with minimal signal loss and are immune to electromagnetic interference, making fiber ideal for high-bandwidth applications like streaming, gaming, and cloud computing .

Types of Fiber Deployment

- FTTH (Fiber to the Home): Direct fiber connection from the provider to your home, offering the fastest and most reliable performance .
- FTTC (Fiber to the Cabinet): Fiber reaches a nearby street cabinet, with the final connection to the home using copper wires .
- FTTP (Fiber to the Premises): Similar to FTTH but may include multi-unit buildings or businesses .

Installation Process

- Site Survey and Planning: The ISP assesses the area, maps terrain, utility lines, and obstacles, and determines whether the fiber will be installed overhead or undergrou...
