

Bus joint temperature measurement

Overview

Switchgear bus temperature monitoring is the continuous, real-time measurement of thermal conditions at bus bar joints, breaker contacts, and cable terminations inside medium-voltage and low-voltage switchgear — without requiring panel shutdown or manual inspection. Overheating at bus bar. Temperature rise testing is one of the recommendations of IEC 61439; our system for monitoring switchgear and busbars is easily integrated with new installations or retrofitted to existing infrastructure. By delivering real-time alerts at the joint level, it helps operators take action before issues escalate, improving system reliability. Continuous, real-time busbar temperature monitoring and hot spot detection for MV & HV switchgear, substations and power plants — EMI-immune, calibration-free, fully SCADA-integrated. Prevent busbar overheating before it becomes a catastrophic fault.
