

Cables are directly plugged into the distribution box

Article Overview

A cable can be directly connected to a distribution box by following proper wiring, grounding, and protective device installation to ensure safety and compliance with electrical standards.

Key Steps for Direct Connection

1. Identify Input and Output: The main power supply (phase and neutral) should be connected to the input terminals of the main MCB or main switch inside the distribution box. This ensures that all downstream circuits receive power safely .**
2. Cable Selection: Use a cable with a gauge at least equal to the incoming supply cable. For most distribution boxes, the maximum cable cross-section is typically 10 mm², but this depends on the load and local regulations .**
3. Protective Devices: Install circuit breakers (MCBs) and residual current devices (RCCBs) as required. The main MCB handles the total incoming load, while single-pole or double-pole MCBs protect individual circuits. RCCBs provide protection against leakage currents .**
4. Grounding: Connect the earth wire from the incoming supply to the earth link in the distribution box. All metallic parts of the box and connected loads should also be grounded to prevent electric shock .**...
