

Can single-mode fiber be used one-to-one

Article Overview

Yes, single-mode fiber can be used one-to-one, either with separate fibers for transmit and receive or using a single fiber with bidirectional (BiDi) technology.

Standard One-to-One Configuration

In a traditional one-to-one setup, single-mode fiber typically uses two separate strands: one for transmitting (TX) and one for receiving (RX). This is known as a duplex configuration and is the most common approach for long-distance, high-speed networks because it ensures minimal signal interference and maximum reliability . Each fiber carries a single mode of light, which reduces dispersion and allows for long-distance transmission, often spanning several kilometers .

Single-Fiber (BiDi) One-to-One Configuration

Single-mode fiber can also operate one-to-one over a single strand using bidirectional (BiDi) transceivers. These modules use wavelength division multiplexing (WDM) to transmit and receive signals simultaneously on the same fiber. For example, one wavelength (e.g., 1310 nm) is used for transmission in one direction, while a different wavelength (e.g., 1550 nm) is used for reception in the opposite direction . BiDi modules require a matching pair of transceivers, each tuned to complementary wavelengths, and are commonly used to save fiber infrastructure and reduce installation costs.
