

Characteristics of Optical Receiver Noise

Overview

Optical receiver adds noise; usually thermal noise and shot noise. In communication systems, where electrical, radio or optical signals are transmitted; noise can be viewed as an impairment resulting in the degradation of the information contained in the signal [1,7]. OSNR for each level and for complete signal can be defined The signal at the output of an optical amplifier in response to a noise free signal at the input is The following formulation accounts for. One of the most misunderstood concepts in RF and Microwave engineering is noise figure, and specifically how it contributes to the sensitivity of a receiver. To understand these concepts, lets start at a high level. Dynamic Range in Receivers The purpose of an RF or Microwave receiver is to detect. The challenge is to find a way to determine the QoS of an optical transmission channel independent of data format and bit rate within a short time frame. The analysis is based, assuming an input signal with.
