

Cold Aisle Cabinet Installation Precautions

Overview

Keep the aisle containment system in a controlled indoor environment, away from moisture, temperature extremes, flammable liquids and gasses, conductive contaminants, dust and direct sunlight. Leave adequate space at the front and rear of the racks for proper ventilation. By isolating the cold aisle, containment reduces unintended mixing of cold supply air with hot exhaust air, maintaining uniform, predictable. More frequently, data centers are using hot and/or cold aisle cooling containment solutions to help with managing airflow, eliminating hot spots and improving energy efficiency. This method raises the temperature of the air returning to a Computer Room Air Conditioner (CRAC) unit, which allows the unit to operate more efficiently. (For ganged cabinet applications) Alignment. The ArcTiv Aisle Containment System offers a low-cost, modular design, compatible with Server Racks for greater flexibility and compatibility while minimizing overall data center costs by managing and containing airflow inside the data room. For aluminum cabinets, after the door is opened to 90 degree, the pin on the hinge should be removed and the door should be pulled out.
