

Connect a double-core cable to a pigtail

Article Overview

A dual-core fiber optic cable is typically connected using pigtails, which are short fibers with a factory-terminated connector on one end and bare fiber on the other, allowing precise splicing to the main cable.

Understanding Dual-Core Fiber Cables

A dual-core fiber optic cable contains two separate optical fibers within a single jacket, often used for duplex communication where one fiber transmits and the other receives signals. These cables are common in high-speed networks, data centers, and FTTH (Fiber to the Home) deployments, providing simultaneous bidirectional communication.

Role of Pigtails

A fiber optic pigtail is a short length of fiber with a factory-polished connector on one end and bare fiber on the other. The bare end is designed to be fusion-spliced or mechanically spliced to the fibers in the dual-core cable, creating a permanent, low-loss connection. Pigtails are preferred over field-terminated connectors because factory-polished connectors ensure precise ferrule geometry, low insertion loss, and high return loss, which are difficult to achieve consistently in the field.

Connection Process

- Prepare the dual-core cable: Strip the outer jacket and buffer coating to expose the two individual fibers.
- Splice the pigtail: Align each bare fiber of the pigtail with the corresponding fiber i...
