

Croatia Data Center Cold Aisle Waterproof Type

Article Overview

Cold aisle containment systems separate cold supply air from hot exhaust air, and waterproof variants protect IT equipment from moisture while optimizing cooling efficiency.

Overview of Cold Aisle Containment

Cold aisle containment (CAC) is a proven method for managing airflow in data centers, where server racks are arranged so that the fronts face each other, forming a corridor known as the cold aisle . Cold air is supplied to this aisle, and servers draw it in through their front intakes. After passing through the equipment, the heated air exits into the adjacent hot aisle, preventing hot and cold air from mixing . This separation improves cooling efficiency, reduces energy consumption, and extends equipment life .

Waterproof and Physical Containment Features

For environments where moisture or water exposure is a concern, waterproof cold aisle containment systems are available. These systems typically include:

- Sealed panels and doors made from materials like polycarbonate (Lexan) or aluminum, which prevent water ingress while maintaining airflow separation .
- Sliding or hinged doors at aisle ends to allow access while keeping the aisle enclosed
