

Distribution box electric switch linkage

Article Overview

In a distribution box, electric switches, MCBs, and protective devices are interconnected through busbars, neutral links, and earth links to safely distribute power to multiple circuits.

Key Components and Their Linkage

Main Switch / Main MCB: The main switch controls the entire power supply to the distribution box. It is usually a double-pole MCB for single-phase systems and connects directly to the incoming phase and neutral wires from the main supply. Turning on the main switch energizes all downstream circuits . **RCCB / RCD:** The Residual Current Circuit Breaker (RCCB) monitors current flow and disconnects the circuit if leakage is detected, protecting against electric shocks. The output of the main MCB is connected to the input of the RCCB, which then feeds the branch MCBs . **Branch MCBs:** Single-pole MCBs are used for individual loads, connecting only the phase wire from the RCCB output, while double-pole MCBs connect both phase and neutral for special loads. The neutral wires from single-pole MCBs are connected to the neutral link . **Busbars and Links:**

- **Neutral Link:** Distributes neutral to all circuits and connects to the neutral terminal of the RCCB.
- **Earth Link / Earth Bar:** Connects all metallic parts, load earth wires, and the distribution box body to the grounding system, ensuring safety .
- **Busbars:** Copper or aluminum bars distribute power from the main switch to branch MCBs efficiently. Comb busbars are preferred for neat and safe connections
