

Dual-port connection method for fiber optic terminal box

Article Overview

A dual-port fiber optic terminal box connects one input fiber to two output fibers using splicing, adapters, and optional PLC splitters, providing organized termination and distribution for FTTH or FTTB networks.

Overview

A dual-port fiber optic terminal box serves as a junction between the backbone fiber and drop cables leading to end users. It typically includes one input port and two output ports, allowing the connection of two SC simplex or duplex LC adapters and optionally a 1×2 PLC splitter for signal distribution . These boxes are designed for wall-mount installation and provide mechanical and fusion splicing, storage, and protection for fiber connections .

Connection Method

- **Input Fiber Termination:** The incoming fiber from the backbone or OSP cable is stripped, cleaned, and prepared for splicing. It is then either fusion-spliced or mechanically spliced to a pigtail inside the terminal box .
- **Splitter Integration (Optional):** If a 1×2 PLC splitter is used, the input fiber is connected to the splitter, which divides the optical signal into two outputs. The splitter is mounted in a dedicated compartment within the box .
- **Output Fiber Connection:** The two output fibers are routed to the SC or LC adapters. These adapters allow easy connection to drop cables leading to customer premises. The fibers are secured in splice trays or storage areas to prevent bending or damage...
