

Extra-high Mineral Cable Laying Tray

Article Overview

Extra-high mineral cable trays are robust support systems designed to carry heavy or high-density electrical and instrumentation cables, often in industrial, offshore, or high-load applications.

Overview

Extra-high cable trays are engineered to support large volumes of power, control, and instrumentation cables. They are particularly suitable for environments where high mechanical strength, fire resistance, and electrical safety are critical, such as power plants, oil and gas facilities, and industrial complexes . These trays provide a structured pathway for cables, ensuring organized routing, easy maintenance, and reduced risk of damage.

Materials and Construction

Cable trays for heavy-duty or extra-high applications are typically made from:

- Galvanized steel: Offers high strength and corrosion resistance .
- Stainless steel: Ideal for corrosive or offshore environments .
- Aluminum: Lightweight and corrosion-resistant, suitable for moderate loads .
- Fiberglass (FRP/GRP): Non-conductive, corrosion-resistant, and flame-retardant for harsh environments . The trays may feature ladder, channel, or wire mesh designs, with ladder trays being preferred for heavy power cables due to their solid side rails and wide rung spacing, which provide excellent support and load distribution
