

Fiber Optic Passive Components Factory Production

Article Overview

Fiber optic passive components are manufactured to guide, split, combine, or filter light without amplification, with production focusing on precision, low loss, and stability across operating conditions.

Types of Passive Components

Fiber optic passive components include:

- Couplers and Splitters: Devices that divide or combine optical signals, often made using fused biconical taper (FBT) or planar lightwave circuit (PLC) techniques .
- Isolators and Circulators: Non-reciprocal devices that prevent back reflections and direct light in a specific path, critical for fiber lasers and amplifiers .
- Fiber Bragg Gratings (FBGs): Reflect specific wavelengths while transmitting others, used for filtering, dispersion compensation, and laser stabilization .
- Wavelength Division Multiplexers (WDMs): Combine or separate multiple wavelengths for dense optical networks .
- Patchcords and Connectors: Passive links that connect components and systems, often polarization-maintaining (PM) for high-precision applications .

Production Process

- Design and Specification: Components are designed with strict tolerances for insertion loss (IL), return loss (RL), and polarization-dependent loss (PDL). Specifications are translated into process windows, including alignment, AR coating...
