

Fiber Optic Splice Box Tutorial

Article Overview

Proper use of fiber optic splice boxes involves careful fiber preparation, secure cable installation, organized fiber management, and precise splicing to ensure low-loss, reliable connections.

Step 1: Fiber Preparation

- **Remove the Cable Jacket:** Strip the outer jacket of the optical cable, including any shielding or armor, to expose the loose tubes. Leave approximately 3 meters of cable for preparation .
- **Clean and Abrade:** Clean the loose tubes and strength member sheath using a suitable cleaning solution. Remove excess filling and abrade the outer cable jacket (about 150 mm) with sandpaper to ensure a clean surface for sealing .

Step 2: Cable Installation in the Splice Box

- **Select and Attach Sealing Rings:** Choose sealing rings that match the cable's outer diameter and place two rings on the cable .
- **Insert the Cable:** Position the cable into the designated entry port of the splice box.
- **Grounding:** Connect and ground the cable's shield layer if applicable.
- **Seal with Tape:** Wrap self-adhesive sealing tape between the sealing rings to create a secure, sealed cable end.
- **Secure the Cable:** Use a hose clamp to attach the sealed cable end to the base of the splice box, ensuring stability.
- **Cable Identification:** Use colored nylon ties (e.g., green for outgoing fibers, blue for customer fibers) to identify cables and trim excess
