

Fiber optic connector insertion loss formula

Article Overview

Insertion loss (IL) in fiber optic connectors is calculated as $IL \text{ (dB)} = 10 \times \log_{10}(P_{in} / P_{out})$.

Definition

Insertion loss represents the optical power lost when light passes through a fiber optic connector, splice, or other optical interface. It is a measure of signal attenuation and is expressed in decibels (dB). Lower insertion loss indicates better performance and higher signal integrity, while excessive loss can degrade transmission quality and reduce effective link distance .

Formula

The standard formula for insertion loss is: $IL \text{ (dB)} = 10 \times \log_{10}(P_{in} / P_{out})$ Where:

- P_{in} = optical power entering the connector or interface
- P_{out} = optical power exiting the connector or interface A lower IL value is better; for example, 0.3 dB is preferable to 0.5 dB .

Typical Values

- Single-mode connectors: recommended $IL < 0.3 \text{ dB}$
- Multimode connectors: recommended $IL < 0.5 \text{ dB}$...
