

Fiber optic patch cord with connector and run through conduit

Article Overview

Fiber optic patch cords can be run through conduit safely by using proper conduit sizing, careful handling, and pulling techniques that protect the cable and connectors.

1. Assess Conduit and Cable Compatibility

Before installation, ensure the conduit is appropriately sized to accommodate the patch cord without excessive bending or compression. Conduit materials like PVC or HDPE are commonly used, with HDPE preferred for underground or long runs due to its flexibility and durability, while PVC is suitable for exposed or wall-mounted applications . Using innerduct can further protect the patch cord and provide a smooth path for pulling .

2. Prepare the Patch Cord

Fiber patch cords are delicate and contain a strength member (usually aramid/Kevlar) that bears the pulling force. Always pull by the strength member, not the fiber itself, to prevent breakage . Use a pulling eye or pull sock attached to the connector to distribute tension evenly and avoid damaging the connector or end face . Clean the connectors before installation to maintain low insertion loss and prevent contamination .

3. Lubricate and Pull Carefully...
