

Fire resistance performance of fire-resistant cable trays

Article Overview

Fire-resistant cable trays are rated based on the duration they maintain circuit integrity under fire, commonly EI60, EI90, or EI120, with testing often following DIN 4102-12 or similar standards.

Understanding Fire Resistance Ratings

Fire-resistant cable trays are designed to maintain the functionality of electrical circuits during a fire, ensuring critical systems like emergency lighting, alarms, and smoke extractors continue to operate. The ratings indicate the duration in minutes that the tray system can withstand fire while preserving circuit integrity:

- EI60: Maintains integrity for 60 minutes; suitable for moderate-risk or secondary systems.
- EI90: Maintains integrity for 90 minutes; commonly used in industrial and infrastructure projects.
- EI120: Maintains integrity for 120 minutes; used for high-criticality systems or areas requiring extended operational continuity .

Standards and Testing

Due to the absence of a unified European standard for cable tray fire resistance, manufacturers often rely on DIN 4102-12, a German standard that tests the entire cable tray system, including cables, supports, and accessories, in a fire exposure ov...
