

Function of aviation plug in power distribution box

Overview

The PDU is a dual channel, redundant, EASA CS-LURS Compliant aircraft electrical system in a single box. It embeds Primary and Secondary Power distribution system, plus battery charging and 14V DC/DC converter functionality. It just requires few connections to power sources and. Power distribution system in an aircraft is very essential in order for the power available at the appropriate generating sources, to be made available at the inputs of the power-consuming equipment and systems, which depends on the type of aircraft and its electrical system, number of consumers. Collins Aerospace's solid state distribution systems are the standard on numerous airplane platforms with over 2 million devices in service. They also provide power to secondary distribution boxes feeding nearly every load used in flight, from in-seat. Our Aerospace specific Primary Power Distribution unit (PDU) provides primary power bus connectivity, transfer, and distribution functions to the aircraft loads. It just requires few connections to power sources and loads to be ready.
