

Galvanized cable tray trough type

Article Overview

Galvanized cable trays, including trough and tray types, are robust systems for supporting and protecting electrical cables, offering corrosion resistance and organized cable management.

Trough-Type Galvanized Cable Trays

Trough-type cable trays are fully enclosed systems typically made from Q235 steel with hot-dip galvanized coating, providing excellent corrosion resistance and mechanical protection for cables. Their rectangular trough shape with removable covers shields cables from dust, moisture, and electromagnetic interference, making them ideal for industrial plants, data centers, and infrastructure projects. Common materials include carbon steel, low-alloy steel, stainless steel, and aluminum alloys, often with additional coatings for enhanced durability. Trough trays are particularly suitable when security and limited cable access are required.

Tray-Type Galvanized Cable Trays

Tray-type cable trays, often referred to as solid-bottom or perforated trays, provide continuous support for cables while allowing for ventilation in perforated designs. Solid-bottom trays offer full protection against mechanical damage and electromagnetic interference, while perforated trays balance cable support with airflow to prevent overheating. These trays are commonly used for power, control, instrumentation, and communication cables, and can be installed on walls, ceilings, or under raised floors
