

How to choose the nm value of an optical power meter for different types of light

Article Overview

Select the optical power meter wavelength to match the light source and fiber type for accurate measurements, typically 850 nm or 1300 nm for multimode fibers and 1310 nm or 1550 nm for single-mode fibers.

Matching Wavelength to Fiber Type

- Multimode fiber: Use 850 nm or 1300 nm, as these are standard transmission wavelengths for multimode systems .
- Single-mode fiber: Use 1310 nm or 1550 nm, which correspond to the low-loss windows of single-mode fibers .
- Special applications: For CWDM or PON systems, select the wavelength that matches the specific channel or service wavelength .

Detector Considerations

The type of photodetector in the optical power meter affects the usable wavelength range :

- Silicon (Si) detectors: Sensitive from 400–1000 nm, suitable for visible light and short-wavelength multimode fiber (e.g., 665 nm or 820 nm LEDs).
- Germanium (Ge) detectors: Sensitive from 800–1600 nm, commonly used for telecom wavelengths.
- Indium-Gallium-Arsenide (InGaAs) detectors: Sensitive from 900–1700 nm, ideal f...
