

How to find the zero point in the distribution box circuit

Article Overview

The zero point in a distribution box is the neutral busbar, where all neutral wires from the loads are connected and which is typically linked to the incoming neutral from the main supply.

Identifying the Zero Point (Neutral) in a Distribution Box

-

Locate the Neutral Busbar: In a distribution box, the neutral busbar is a metal strip with multiple screw terminals, usually positioned separately from the phase busbars. All neutral wires from the output circuits are connected here, and it is connected to the neutral line coming from the main supply or energy meter .

-

Trace the Incoming Neutral: The neutral wire from the main supply or energy meter enters the distribution box and is connected to the neutral busbar. This is the main zero point of the system .

-

Check Connections to Protective Devices: In single-phase systems, the output of the RCCB or RCD is connected to the neutral busbar, and from there, neutral wires are distributed to individual circuits. This ensures that the neutral is properly referenced and protected .
