

How to fuse 12-core fiber optic trays

Article Overview

Fusing 12-core fiber optic trays requires careful preparation, precise alignment, and protective sleeving to ensure low-loss, durable connections.

Tools and Materials Needed

- Fusion splicer suitable for multi-core or ribbon fibers
- Fiber cleaver for precise 90° cuts
- Fiber strippers for removing outer jackets and coatings
- Alcohol (99%) and lint-free wipes for cleaning
- Heat-shrink splice protection sleeves for joint protection
- Microscope or inspection scope to check fiber end faces

Step-by-Step Fusion Process

1. Prepare the Fiber Ends Strip the outer jacket and buffer coating of each fiber carefully, exposing the bare glass cores. For 12-core ribbon fibers, ensure all fibers are evenly stripped to the recommended length (typically 3-5 cm) without nicking the glass. Clean each fiber with alcohol and a lint-free cloth to remove oils and debris, as contamination can cause high splice loss . 2. Insert Protective Sleeves Slide a heat-shrink splice sleeve onto each fiber or ribbon before cleaving. This sleeve will protect the splice after fusion . 3. Cleave the Fibers Use a high-precision cleaver to create a flat, perpendicular end face on each fiber. For ribbon fibers, ensure all 12 fibers are cleaved uniformly to maintain alignment during splicing . 4. Align and Fuse Place the fibers into the fusion splicer's V-grooves. Most modern splicers allow automatic alignment for ribbon fibers, aligning all 12 cores simultaneously. The splicer then us...
