

How to install cable trays on slope protection

Article Overview

Cable trays on slope protection can be safely installed by using properly anchored supports, level alignment, and secure fastening to withstand environmental and cable loads.

Planning and Preparation

Before installation, assess the slope to determine the gradient, soil stability, and potential environmental loads such as wind, rain, or erosion. Choose a cable tray type suitable for the application: ladder trays for large power cables or ventilated troughs for smaller control cables, considering corrosion resistance if exposed to moisture or chemicals (). Ensure compliance with the National Electrical Code (NEC) Article 392 for cable tray fill, grounding, and support spacing ().

Support and Anchoring

- **Anchor Points:** Install supports at regular intervals along the slope. Standard spacing is typically 1.5–2 meters, but adjust based on tray type, cable weight, and slope angle ().
- **Support Types:** Use center-hung supports, brackets, or struts anchored into concrete, rock, or reinforced soil structures. For slopes, angled brackets or custom-fabricated supports may be required to maintain tray alignment ().
- **Load Considerations:** Ensure each support can handle the maximum cable load, including dynamic forces from wind or seismic activity. Typical maximum load per hanger ranges from 318 kg to 340 kg ()....
