

How to wire the spare switch in the distribution box

Article Overview

To wire a spare switch in a distribution box, connect the phase wire from the output of the RCCB or main MCB to the input of the spare switch, and connect the neutral and earth wires to their respective bus bars.

Step-by-Step Guide

1. Identify the Spare Position: Locate the reserved slot in your distribution box, usually on the right side, intended for future or spare circuits . Ensure the slot can accommodate a single-pole or double-pole MCB depending on your intended load. 2. Turn Off Power: Before wiring, switch off the main MCB and verify that no voltage is present using a voltage tester to ensure safety . 3. Connect the Phase Wire: Take a phase (live) wire from the output of the RCCB or main MCB and connect it to the input terminal of the spare MCB. If you plan to feed multiple switches from the same supply, you can use a pigtail connection under a wire nut . 4. Connect the Neutral Wire: For a single-pole MCB, the neutral wire from the load should be connected to the neutral bus bar in the distribution box. For a double-pole MCB, connect both phase and neutral wires from the RCCB output to the MCB input . 5. Connect the Earth Wire: Attach the earth wire from the load to the earth bus bar in the distribution box. Ensure all metallic parts of the box are also properly earthed . 6. Neat Wiring Practices: Use plastic ties to bind wires neatly, maintain uniform spacing, and route wires according to standard conventions (phase wires on the left, outgoing wires on the right) to reduce the risk of short circuits and make future maintenance easier . 7. Safety Check: After wiring, inspect all connections to ensure they are secure, no ex...
