

Indoor switch optical port interconnection

Article Overview

Indoor optical port interconnection involves linking fiber-optic ports of switches to distribution boxes or endpoints using structured cabling, preterminated systems, and proper port management to ensure high-speed, reliable connectivity.

All-Optical Switches

All-optical Ethernet switches use fiber-only ports, eliminating electrical-to-optical conversions and reducing latency, power consumption, and points of failure . These switches are ideal for indoor environments where high-speed backbone or aggregation traffic is required, supporting interfaces such as 10G, 25G, 40G, and 100G. They can connect directly to servers or endpoints with fiber NICs, making them suitable for data centers, high-performance computing clusters, or fiber-to-the-room deployments .

Co-Packaged Optics (CPO)

CPO technology integrates optical modules and switch ASICs in the same package, shortening electrical paths and improving signal integrity and power efficiency . For indoor switches, this means higher reliability and reduced heat generation, which is particularly beneficial in compact telecom rooms or concealed cabinets.
