

Inspection Batch for Distribution Box Installation

Article Overview

Inspection of distribution boxes involves material verification, installation checks, pre-commissioning tests, and formal inspection requests to ensure compliance with project specifications and safety standards.

Material and Pre-Installation Inspection

Before installation, all received distribution boards (DBs) must be inspected for compliance with approved material submittals, checking for damages, discrepancies, or non-conforming components. Unsuitable materials should be removed immediately. Verify the size, IP/NEMA rating, and durability of the DB against project requirements, and ensure the installation location is dry, accessible, and properly ventilated. Confirm that the floor level and plastering tolerances meet specifications before positioning the DB.

Installation Checks

Install the empty panel box securely using nuts and bolts, then mount switchgear and accessories according to manufacturer instructions. Tighten all electrical connectors and terminals to specified torque values. Ensure proper grounding, neat cable management, correct wire gauge, and breaker sizing. Label feeders, bus bars, and panel devices clearly. Protect the enclosure from construction debris and plastering during installation
