

Installing ladder-type cable trays without directly going upstairs

Article Overview

Ladder-type cable trays can be installed at elevated levels using mechanical lifting systems, modular assembly, or temporary supports to avoid manually carrying trays upstairs.

Mechanical Lifting and Hoisting

One of the safest methods is to use hoists, pulleys, or chain blocks to lift the trays from the ground to the desired level. Trapeze or swing supports, commonly used for ladder trays, allow the tray to be suspended and adjusted horizontally once lifted, minimizing the need for installers to carry heavy sections upstairs directly. Ensure that all lifting equipment is rated for the tray weight and complies with safety standards.

Modular or Sectional Assembly

Instead of lifting full-length trays, consider assembling the tray in shorter sections on the ground and then hoisting each section individually. This reduces weight and allows easier handling. Once suspended on vertical hangers, the sections can be connected using tray clips or bolts, as described in standard installation guides. This method also allows for precise alignment without requiring installers to climb with heavy trays.
