

Is fiber optic cable manufacturing profitable

Article Overview

Manufacturing fiber optic cables is currently profitable, with first-year revenues for a medium-scale plant reaching around \$7.6 million and net profit margins of 4-5%, though initial setup costs are substantial.

Market Overview

The global fiber optic cable market was valued at approximately \$7.2-7.21 billion in 2025 and is projected to grow to \$15-15.9 billion by 2034, reflecting a CAGR of 8.5-9.2% . Growth is driven by 5G rollout, broadband expansion, data center demand, smart city initiatives, and submarine cable projects. This strong market growth supports profitability for manufacturers who can maintain quality and scale.

Profitability

A fiber optic cable plant producing 90 km of cable per day can generate \$7.6 million in revenue in its first year, with gross profit margins improving from 7.6% to 7.9% and net profit rising from 4.1% to 4.7% by year five . Profitability depends on efficient operations, raw material sourcing, and meeting high-quality standards for telecom and data applications.

Manufacturing Costs

Setting up a fiber optic cable manufacturing plant involves significant capital and operational expenditures:

- **Capital Expenditure (CapEx):** Includes land, plant construction, machinery (fiber drawing towers, coating and curing equipment, stranding and sheathing machines), and utilities. Costs vary by plant size and location but typically range from \$2-5 million for a medium-scale facility .
- **Operating Expenditure (OpEx):** Covers raw materials (ultra-pure glass or plastic preforms, coatings, jacketing materials), labor, energy, packaging, transportation, and maintenance. Tariffs on imported materials can add hundreds of millions in sector-wide costs, with a severe impact on U.S. manufacturers .
- **Raw Materials:** Ultra-pure glass is the primary input, requiring precise handling and quality control. Protective coatings, strength members, and jacketing materials add to costs
