

Is the grounding of the three-level distribution box good

Overview

- Good system grounding provides the path for normal load and fault currents while maintaining load and controls temporary overvoltage. Grounding is necessary to assure correct operation of electrical devices, to assure safety. Grounding is a mechanism to protect distribution equipment and people under normal operating conditions, abnormal operational (overcurrent and overvoltage) responses, and hazardous conditions such as shocks. Power from factory ground must be installed by a qualified electrician. Each DISTRIBUTION BOX and controller must be grounded. When lightning strikes or a rogue voltage surge decides to crash the party, proper grounding steps in like a seasoned bouncer, redirecting danger away from. Safety of Personnel: By safely channeling fault currents into the ground, proper grounding helps to reduce the risk of electric shock to personnel.
