

Models of ladder-type and trough-type cable trays

Article Overview

Ladder-type cable trays feature side rails connected by rungs for maximum airflow, while trough-type (perforated) trays have a solid or perforated bottom for enhanced cable support and protection.

Ladder-Type Cable Trays

Design and Structure: Ladder-type trays consist of two longitudinal side rails connected by evenly spaced rungs, resembling a ladder. The open design allows excellent ventilation around cables, reducing heat buildup and maintaining safe operating temperatures . **Materials:** Commonly made from galvanized steel, aluminum, or FRP, these trays are durable and suitable for heavy-duty applications . **Applications:** Ideal for power plants, substations, heavy industrial facilities, and outdoor installations, ladder trays support long horizontal runs and heavy power cables. Their open structure allows easy cable installation, maintenance, and future expansion . **Advantages:**

- Superior heat dissipation due to open rungs
- High load-bearing capacity for heavy cables
- Easy access for cable tying and maintenance
- Suitable for long spans and overhead installations
