

Multifunctional Integrated Optical Power Meter

Article Overview

An integrated optical power meter measures the power of optical signals and converts them into electrical readings to monitor, test, and maintain fiber optic systems.

Core Function

An integrated optical power meter (OPM) is designed to measure the power of light signals in optical fibers or other optical systems. It captures the optical signal using a photodetector, such as a photodiode, thermopile, or pyroelectric sensor, which converts the light into an electrical current or voltage. This electrical signal is then processed and displayed, typically in watts or decibel-milliwatts (dBm), allowing technicians to quantify the optical power accurately .

Components and Operation

The main components of an integrated OPM include:

- **Sensor/Detector:** Converts incoming light into an electrical signal, calibrated for specific wavelength ranges .
- **Measuring Amplifier:** Processes the electrical signal to provide accurate readings, accommodating DC, AC, or pulsed optical signals .
- **Display Unit:** Shows the measured optical power and often allows the user to select the test wavelength . Integrated OPMs often combine these components into a singl...
