

No signal after plugging in the fiber optic router

Article Overview

A "no signal" issue with a fiber optic cable is usually caused by physical damage, loose connections, faulty transceivers, or configuration errors.

Check Physical Connections

Start by inspecting the fiber optic cable and connectors. Ensure the cable is not bent, kinked, or damaged, and that connectors are clean and properly seated in both the router and the ONT (Optical Network Terminal) or switch port . Dust or oil on connectors can block the light signal, so clean them with lint-free wipes and isopropyl alcohol if necessary .

Inspect the Transceiver

If your router uses an optical transceiver (SFP, SFP+, or QSFP), verify that it is firmly inserted and compatible with your router and fiber type . Check the transceiver's LED indicators: a green light usually means it is functioning, while red or amber may indicate a fault . Testing the transceiver in another device can help determine if it is defective .

Test Signal Strength

Use an optical power meter or OTDR to measure the signal. Values outside the expected range (typically -15 dBm to -30 dBm) suggest a weak or broken signal . If...
