

Operation and Maintenance of ONT Optical Network Terminal SFP

Article Overview

ONT SFP modules in GPON networks convert optical signals to electrical signals at the user end and require careful installation, monitoring, and maintenance to ensure reliable high-speed connectivity.

Overview of ONT SFP in GPON Networks

ONT SFP modules are small form-factor pluggable transceivers used in GPON systems to connect end-user devices to the optical network. They operate in a point-to-multipoint (P2MP) architecture, receiving downstream data broadcast from the OLT (Optical Line Terminal) and transmitting upstream data in assigned time slots using TDMA (Time Division Multiple Access). These modules comply with ITU-T G.984.2 standards and typically work over single-mode fiber with SC connectors. ONT SFPs are available in Class B+ and Class C+, differing in transmit power and receive sensitivity, which affects the number of ONTs supported per OLT port.

Installation and Configuration

- **Physical Installation:** Insert the ONT SFP into the ONT device, ensuring proper orientation and secure connection. Avoid bending the fiber beyond recommended limits to prevent signal loss.
- **Network Connection:** Connect the ONT SFP to the OLT via the optical distribution network (ODN), which may include passive splitters. Ensure the fiber path is clean and free of dust or debris.
- **Device Configuration:** Access the ONT management interface via web GUI or CLI t...
