

Optical Module Single-Mode Serial Number

Article Overview

You can identify a single-mode SFP module and retrieve its serial number via device commands or by checking module labels and color coding.

Identifying Single-Mode SFP Modules

Single-mode SFPs (SMF) are designed for long-distance transmission and typically use a laser light source with a small core diameter ($\sim 9\text{ }\mu\text{m}$). They are often labeled as “SM” or “single mode” and may feature blue or yellow-colored connectors or bail clasps, while multimode SFPs (MMF) use orange, aqua, or green connectors for shorter distances . Checking the manufacturer's documentation or the module label is recommended, as color coding can vary by brand .

Retrieving the Serial Number

On network devices that support SFP modules, you can query the serial number using device-specific commands. For example, on FortiGate devices:

- To view all transceivers: `get system interface transceiver`
 - To view a specific interface: `get system interface transceiver`
 - For detailed hardware info: `diagnose hardware deviceinfo nic show system interface`
- The output typically includes vendor name, serial number, fiber type, temperature, voltage, and optical power. Example output: Vendor Name: FIBERXON INC. Serial No.: A*****7
