

Outdoor optical cable branch

Article Overview

Outdoor optical cable branches use specialized fiber optic cables designed for environmental durability, mechanical protection, and flexible deployment in aerial, buried, or duct systems.

Types of Outdoor Fiber Optic Cables

Loose Tube Cables: These are the most common outdoor cables, featuring optical fibers encased in gel-filled buffer tubes that protect against moisture and temperature extremes. They are ideal for long-distance backbone networks and high-fiber-count applications, providing low attenuation and stable signal performance .

Ribbon Cables: Fibers are arranged in flat ribbons, allowing high-density fiber counts and faster mass fusion splicing. Ribbon cables are suitable for high-capacity networks and urban deployments where space is limited .

Micro Cables: Designed for microduct systems, these cables are smaller and lighter than standard loose tube cables but maintain high fiber counts. They are ideal for congested duct environments and cost-effective installations .

Armored Cables: These include a protective metal or non-metallic layer to resist rodent damage, crushing, and moisture. Armored cables are recommended for direct-buried or exposed installations .

All-Dielectric Self-Supporting (ADSS) Cables: Self-supporting cables for aerial deployment without a messenger wire. They are suitable for installation near high-voltage lines or where additional support is impractical .

Figure-8 Cables: Designed for aerial use, these cables have a figure-8 shape with a fiber optic loop and an integrated messenger wire, simplifying pole attachment and tension management .
