

Peripheral Network Cabinet Production

Article Overview

Peripheral network cabinets are manufactured through integrated sheet metal production lines, offering customizable sizes, ventilation, and cable management for data centers, telecom, and industrial networks.

Manufacturing Process

Peripheral network cabinets are typically produced using end-to-end sheet metal fabrication lines. The process begins with high-quality raw sheet metal, sorted by material type and thickness, followed by shearing, fiber laser cutting, and CNC turret punching to create chassis blanks, mounting rails, and ventilation patterns . Panels are then formed, bent, and welded using multi-axis CNC machines to ensure structural integrity and precise dimensions . Finally, cabinets undergo powder coating, assembly, and quality control, producing standardized or custom enclosures ready for deployment .

Materials and Standards

Common materials include carbon steel, stainless steel, and aluminum, chosen for durability and thermal performance . Cabinets follow EIA-310 19-inch mounting standards, with heights ranging from 42U to 48U and customizable depths from 600mm to 1200mm . Wall-mount and floor-standing models are available to suit different deployment environments, from compact server rooms to large data centers
