

Pigtail models for RRU and BBU connections

Article Overview

Pigtail cables, typically fiber optic or hybrid, are used to connect RRUs to BBUs, ensuring high-speed, low-latency communication in cellular networks.

Overview of RRU-BBU Connectivity

In modern cellular networks, RRUs are installed near antennas, often on towers or rooftops, while BBUs are located at the base of the tower or in a nearby equipment room. The connection between them is primarily achieved using fiber optic pigtail cables, which carry digital signals via the Common Public Radio Interface (CPRI) or enhanced CPRI (eCPRI) protocols. These cables are critical for maintaining signal integrity, minimizing latency, and supporting high bandwidth requirements for 4G and 5G networks.

Types of Pigtail Models

- Single Fiber Pigtails
 - Used for point-to-point connections between one RRU and one BBU.
 - Typically terminated with LC or SC connectors for easy plug-and-play installation.
 - Suitable for small-scale or macrocell deployments with limited RRUs.
- Multi-Fiber or Ribbon Pigtails
 - Contain multiple fibers in a single jacket, allowing one cable to connect multiple RRUs or multiple sectors of a single RRU.
 - Reduces cable congestion on towers and simplifies installation in dense urban sites...
