

Power of optical modules in telecom routers

Overview

Optical modules are the foundation of modern telecom networks, supporting 5G traffic between radios, aggregation points, and core networks while meeting stringent requirements for bandwidth, latency, and reliability. They form the backbone of long-distance, high-capacity data transport in modern telecom networks. Deployed across fronthaul, midhaul, and backhaul. In telecommunication applications, target impedance serves as a crucial benchmark for PDN design. It ensures that the die operates within an acceptable level of rail voltage noise, even under the worst-case transient current scenarios, by defining the maximum allowable PDN impedance for the power. The optical module serves as a crucial component in optical fiber communication systems, operating at the physical layer, which is the lowest layer in the OSI model. Its primary function is to achieve optoelectronic conversion by converting electrical signals into optical signals and vice versa.
