

Red light source calibration RoHS

Article Overview

Red light calibration sources, such as 660 nm LEDs or lasers, can be calibrated to NIST-traceable standards while ensuring RoHS compliance in electronic equipment.

Calibration of Red Light Sources

Red light sources used for calibration, typically around 660 nm, are employed to verify the spectral response and reflectance of optical systems, including spectrometers and barcode verifiers. These sources are often radiometrically calibrated to provide known intensity values with low uncertainty, ensuring accurate and reproducible measurements across UV, visible, and NIR wavelengths (). Calibration can be performed using ISO 17025-certified laboratories or via factory-traceable standards such as GS1 U.P.C. Primary Verification Standards (). For example, the Inspector 5000 system uses a 660 nm red reflectance calibration plaque traceable to GS1 and NIST standards, confirming compliance with ISO15416-1 and ANSI X3.182-1990 methodologies ().

RoHS Compliance Considerations

RoHS (Restriction of Hazardous Substances) limits the use of certain hazardous materials in electrical and electronic equipment, including lead, mercury, cadmium, hexavalent chromium, and specific flame retardants (). When selecting or manufacturing red light calibration sources, it is essential to ensure that all components, including LEDs, housings, and solder materials, comply with RoHS limits. Modern RoHS compliance also considers traceability of materials and supplier documentation to avoid restricted substances in the supply chain ()....
