

Relationship between optical modules and PCBs

Overview

Optical Module PCB refers to the printed circuit board (PCB) used within optical modules. It serves to mount components such as optoelectronic chips, driver circuits, and control chips, enabling high-speed signal transmission, electro-optical/optical-electrical conversion, and. As artificial intelligence, 5G infrastructure, and hyperscale data centers demand ever-faster data transmission, optical modules have become the bedrock of modern communication. This evolution not only enhances transmission efficiency but also ensures reliability in demanding. Optical module PCBs are essential components that enable the conversion of electrical signals into optical signals, facilitating efficient and long-distance transmission through optical fibers. Critical Metrics: Signal integrity (insertion loss, return loss) and thermal management are the two. The optical PCB incorporates an optical data transmission layer in its design, achieving higher transfer rates than the traditional board that relies on conductive materials.
