

Relay protection does not fail to operate

Overview

The fault is mainly caused by incorrect protection settings, reversed CT polarity, open CT secondary circuit and wrong logic configuration. Carry out secondary injection testing, cross-check with wiring diagrams, and test trip circuit continuity. Core idea: Protective relays monitor electrical quantities and command protective devices to isolate faults or abnormal operating conditions. This is why working with a reliable protection relay supplier and applying correct engineering practices during design, installation, and commissioning is. When a protection relay fails to operate during a real fault, the consequences can be severe — prolonged fault duration, equipment damage, and major production losses. Relay nuisance tripping (false relay operation / relay trips without fault) manifests as breaker tripping with no actual fault, unwanted relay pickup during motor startup and unplanned random equipment shutdown. While this is bad, It's not a.
