

Relay protector light is on red

Article Overview

A red LED on a relay protector can indicate either a fault condition, such as undervoltage or misconfiguration, or simply that the relay coil is energized, depending on the relay model.

Possible Meanings

1. Fault Condition

- On some relays, like the RM4TU, a red LED indicates an undervoltage fault, signaling that the supply voltage is below the required level for proper operation .
 - For Guardmaster Safety Relays (GSR), a solid red PWR/FLT LED may indicate incorrect rotary switch settings, inadequate module spacing, voltage or current spikes, or improper internal safety output positions . Troubleshooting involves checking switch positions, ensuring proper spacing, and testing with a stable power supply.
- #### 2. Normal Operational Indicator
- On RIB® relays, the red LED is a status indicator showing that the relay coil is energized. It does not indicate a problem; it simply confirms that the control signal has activated the relay . If the connected load does not operate while the LED is on, it helps narrow down issues like wiring faults or a locked motor.

Troubleshooting Steps

- Identify the relay type to determine whether the red LED signals a fault or normal operation.
- Check power supply voltage to ensure it meets the relay's specifications.
- Verify switch and dial settings on relays with rotary controls....
