

Router not displaying fiber optic signal light

Article Overview

A fiber optic signal light not illuminating usually indicates a power issue, a disconnected or damaged cable, or a network outage.

Check Power and Connections

First, ensure that your Optical Network Terminal (ONT) and router are properly powered. Verify that the power cable is securely connected to both the ONT and a working wall outlet, and try a different outlet if necessary. If using a power strip, make sure it is turned on. Restarting the ONT and router can often resolve temporary faults .

Inspect Fiber Cables and Connectors

Examine all fiber optic cables for visible damage, sharp bends, or loose connections. Dirty or contaminated connectors are a common cause of signal loss. Clean connectors using lint-free wipes and isopropyl alcohol, and ensure the correct fiber type and polarity are used when reconnecting .

Check Indicator Lights

- No light on the fiber signal LED: The ONT is not receiving a proper fiber signal.
- Red or blinking light: Indicates a loss of signal or connectivity issue.
- Green light: Normal operation . If the fiber light remains off after checking power and cables, log in to your ISP account to see if there is a reported network outage in your area .

Test Equipment

If possible, swap the ONT or router with a known working unit to rule out hardware failure. For longer fiber runs, tools like an optical power meter or OTDR can help locate breaks or points of attenuation .

Firmware and Configuration

Ensure that your router and ONT firmware are up to date, as outdated firmware or misconfigurations can prevent proper signal detection
