

# Selection Guide for DFB Distributed Feedback Lasers DML for Distribution Network Automation

## Overview

□□ For purchasing, use the RP Photonics Buyer's Guide for distributed feedback lasers. It provides an expert-curated supplier directory, buyer-focused technical background information, and structured selection criteria to support professional procurement decisions. Their key features relative to other semiconductor lasers are their single longitudinal mode (single frequency) emission profile, their high stability and their wavelength tunability. It's important to note that the wavelength tunability. A distributed feedback (DFB) laser is a laser where the optical resonator is formed not by discrete mirrors at the ends (as in Fabry-Pérot laser diodes) but by a periodic variation of the refractive index or gain (a Bragg grating) distributed throughout the active medium. As global demand for ultra-stable, narrow-linewidth laser sources continues to rise, Lumentum manufactures indium phosphide (InP) directly-modulated lasers (DMLs) in our internal wafer foundry.
