

Signal Box and Distribution Box Project

Article Overview

The Signal Box Project simulates railway signaling systems, while Distribution Boxes manage decentralized power and signal distribution in industrial and building applications.

Signal Box Project

The openSignalBox Project is an open-source initiative designed to simulate railway signaling systems for both physical and virtual applications . It allows users to:

- Connect restored or virtual signalboxes over the internet, accurately replicating bell codes and block indicators.
- Provide virtual interlocking between lever frames and model railway control buses.
- Simulate route-relay interlocking for panel or IECC interfaces.
- Offer immersive experiences with spatial sound, physical rumbling, and 3D simulation of nearby locations.
- Integrate live train locations and timetables for signalboxes facing operational railway lines. The modular software design supports a variety of applications, from full signalbox simulations to linking individual instruments remotely, making it suitable for enthusiasts, educational purposes, and preservation projects.

Distribution Box Project

Distribution boxes are enclosures that distribute electrical power and signals to multiple circuits safely and efficiently . Key features include:.....
