

Standard wiring diagram for distribution box outgoing lines

Article Overview

Outgoing lines from a distribution box are typically connected through MCBs or RCCBs, with phase wires routed to protective devices, neutral wires to a neutral link, and earth wires to an earth link, following organized wiring and safety standards.

Wiring Arrangement

- **Phase Lines (Live Wires)** The phase wires from the main supply are first connected to the main MCB or isolator. From there, they are routed to the RCCB (if used) and then distributed to individual MCBs for each outgoing circuit. Each MCB protects its respective branch circuit from overcurrent or short circuits. For special loads, double-pole MCBs may be used, while single-pole MCBs are common for standard loads .
- **Neutral Lines** Neutral wires from the supply are connected to a neutral link inside the distribution box. From this link, neutral wires are distributed to each outgoing circuit. When double-pole MCBs are used, both phase and neutral are routed through the MCB; for single-pole MCBs, only the phase passes through the MCB while the neutral connects directly to the neutral link .
- **Earth Lines** All earth wires from the supply and outgoing circuits are connected to the earth link, which is then connected to the earth pit or rod. Proper earthing ensures safety against electric shock and protects the system from faults .

Wiring Direction and Organization

- **Left-to-Right Wiring:** Typically, wiring from the main circuit breaker to branch breakers is routed on the left side, while outgoing lines from the distribution box ar...
