

Switch with optical splitter

Article Overview

A network switch connects to an optical splitter via fiber optic patch cables, allowing a single fiber signal to be distributed to multiple devices while maintaining bidirectional communication.

How It Works

In a Passive Optical LAN (POL) or Fiber-to-the-Home (FTTH) setup, an optical splitter divides a single input optical signal from the Optical Line Terminal (OLT) or main fiber into multiple outputs for devices such as ONTs or switches. The switch can then distribute the network signal to multiple endpoints, such as computers, phones, or Wi-Fi access points. Each output from the splitter carries a portion of the original signal, enabling multiple devices to share the same fiber infrastructure.

Steps to Connect a Switch to a Splitter

- **Identify the Splitter Type and Ports:** Ensure the splitter is compatible with your network, typically a 1x2, 1x4, 1x8, or higher split ratio for fiber networks. Check the connector type (SC, LC, or APC) to match the switch or ONT ports.
- **Connect the Input Fiber:** Use a fiber patch cable to connect the main fiber line from the OLT or source to the input port of the splitter.
- **Connect the Output Fiber to the Switch:** Use another fiber patch cable to connect one of the splitter's output ports to the uplink port of the switch. If the switch is multi-port, each port can connect to a separate ONT or device downstream.
- **Cascading Splitters (Optional):** If more outputs are needed than a single splitter provides, you can cascade splitters by connecting an output of the primary splitter to the input of a secondary splitter. Be mindful that each split introduces signal loss, t...
