

Terminal box direct output to fiber optic cable

Article Overview

A fiber optic terminal box can provide direct output to end devices by splicing or connecting drop cables through adapters or splitters, enabling FTTH or FTTB network access.

Function of a Terminal Box

A fiber optic terminal box serves as the endpoint for fiber distribution in residential, business, or multi-dwelling unit networks. It allows the termination, splicing, and distribution of optical fibers, providing a secure and organized interface for connecting drop cables directly to ONUs or other optical devices . Terminal boxes can be used indoors or outdoors and are designed to protect fibers from moisture, dust, and mechanical stress .

Direct Output Methods

- **Adapter-Based Connection:** Terminal boxes often include SC, LC, FC, or ST adapters that allow pre-terminated drop cables to plug directly into the box, providing immediate optical connectivity to end devices . This method is common in straight-through terminal boxes.
- **Splice-Based Connection:** Inside the box, incoming feeder fibers can be fusion-spliced to pigtails that terminate at adapters, ensuring low insertion loss and secure connections. Extra fiber can be stored in trays to manage slack and prevent bending .
- **Splitter Integration:** Some terminal boxes support PLC splitters (1×2, 1×4, 1×8, 1×16), allowing a single feeder fiber to serve multiple drop cables. This is useful for...
