

The switch has PoE power

Article Overview

Yes, certain network switches can be powered by PoE, either directly as a powered device or via PoE pass-through functionality.

Standard PoE Switches

A typical PoE switch functions as a Power Sourcing Equipment (PSE), delivering both data and electrical power to connected devices like IP cameras, VoIP phones, and wireless access points through a single Ethernet cable. These switches usually require a separate AC power source to operate and provide power to other devices.

PoE-Powered Switches

Some switches are designed to receive power via PoE from an upstream PoE source. These are often called PoE pass-through switches. In this setup, the switch acts as both a powered device (PD) and a PSE: it draws power from an upstream PoE switch or injector to operate its own circuitry and then passes the remaining power to downstream PoE devices. For example, a pass-through switch receiving 30W from a PoE injector may use 5W for itself and provide 25W to connected devices.

Requirements and Considerations

- The upstream PoE source must supply sufficient power to meet the switch's operational needs and the power requirements of connected devices.
- PoE standards vary: PoE (IEEE 802.3af) provides up to 15.4W per port, PoE+ (IEEE 802.3at) up to 30W, and PoE++ (IEEE 802.3bt) up to 60-100W per port
